

Run Documentation

Summary

This commit upgrades the Android build toolchain and several Flutter dependencies to ensure compatibility with newer SDK versions and fix runtime issues caused by breaking API changes in updated packages.

1. *.fvmrc*

Change: Flutter version changed from 3.27.0 → 3.22.3

Reason: Aligned the FVM (Flutter Version Manager) pinned version with the stable version being used for local development to ensure consistent builds across team members.

2. *android/app/build.gradle*

Changes:

- Migrated from legacy `apply plugin:` syntax to new `plugins {}` DSL block
- Removed manual `flutterRoot` SDK path resolution (now handled by Flutter Gradle plugin automatically)
- `compileSdk` bumped from 35 → 36
- Kotlin stdlib version changed from `$kotlin_version` variable → hardcoded 2.1.0

Reason: The new Flutter Gradle plugin (AGP 8.x+) requires the `plugins {}` DSL. The `flutterRoot` manual resolution is no longer needed. `compileSdk 36` is required for the latest Android SDK. Kotlin version is hardcoded to match the version declared in `settings.gradle`.

3. *android/build.gradle*

Changes:

- Removed entire `buildscript {}` block
- Removed deprecated `jcenter()` repository
- Replaced per-plugin namespace injection with a simpler `afterEvaluate` block

Reason: With AGP 8.x, the `buildscript {}` block is no longer needed — plugins are declared in `settings.gradle`. `jcenter()` is deprecated and removed. Namespace injection logic was simplified.

4. *android/gradle/wrapper/gradle-wrapper.properties*

Change: Gradle version bumped from 8.4 → 8.7

Reason: Gradle 8.7 is required to support AGP 8.6.0. Each AGP version has a minimum required Gradle version.

5. *android/settings.gradle*

Changes:

- `com.android.application` plugin: 8.3.2 → 8.6.0
- `org.jetbrains.kotlin.android` plugin: 1.9.22 → 2.1.0
- Added `com.google.gms.google-services` version 4.4.0

Reason: Updated AGP to 8.6.0 for compatibility with Gradle 8.7 and `compileSdk 36`. Kotlin updated to 2.1.0 to match stdlib version. Google Services plugin moved here from the old `buildscript` classpath approach.

6. *lib/main.dart*

Changes:

- Added import: `package:alice/model/alice_configuration.dart`
- `Alice(showNotification: true)` → `Alice(configuration: AliceConfiguration(showNotification: true))`

Reason: The `alice` package was upgraded from `^0.4.2` to `^1.0.0`, which introduced a breaking API change. The constructor now requires an `AliceConfiguration` object.

7. lib/presentation/therapy_detail/therapy_detail_screen.dart

Changes: • Removed import: package:alice/utils/alice_constants.dart
• AliceConstants.white → Colors.white (2 occurrences)

Reason: AliceConstants is no longer exported in alice ^1.0.0. Replaced with standard Flutter Colors.white.

8. pubspec.yaml

All dependency upgrades were necessary to resolve compatibility issues with the updated Flutter SDK and Android build toolchain. Dart SDK constraint widened to <4.0.0 to prevent pub resolution failures with Dart 3.x.

Package	Old Version	New Version	Reason
alice	^0.4.2	^1.0.0	Major upgrade; new API for configuration
fluttermtoast	^8.0.8	^9.0.0	Compatibility with newer Flutter/Android
google_fonts	^6.1.0	^8.1.0	Latest stable, performance improvements
syncfusion_flutter_pdf_viewer	^23.1.39	^26.1.40	Bug fixes and Flutter 3.x compatibility
share_plus	^9.0.0	^11.0.0	Breaking changes in Android share intent
youtube_player_flutter	^9.0.4	^9.1.3	Minor bug fixes
permission_handler	^11.2.0	^12.0.1	Android 14+ permission API changes
Dart SDK env	<3.0.0	<4.0.0	Allow Dart 3.x SDK range

Impact Summary

Area	Impact
Android Build	Migrated to AGP 8.6.0 + Gradle 8.7 — required for compileSdk 36
Kotlin	Upgraded to 2.1.0 — aligns stdlib and plugin versions
Flutter Packages	8 packages upgraded — resolves breaking API changes
Code Changes	2 Dart files updated to adapt to alice ^1.0.0 API
Security Note	google-services.json and GoogleService-Info.plist contain hardcoded Google API keys — consider moving to a secrets manager
